\hat{b} and \hat{a} , $\hat{b} = -175/40 = -.4375$ and $\hat{a} = 100 - (.4375)(160) = 170$. Hence, the estimated demand equation is $Q_d = 170 - 4.375 \cdot P$. Recall from the previous unit that the formula for point price elasticity of demand is $E_p = (dQ/dP)(P/Q)$. Based on the estimated demand function, $dQ/dP = -.4375$.

estimating demand curves should be recognized at the outset. Given the task of estimating the demand curve for a particular product, you might be inclined to plot the quantity demanded of the product in 2003 versus its 2003 price, the quantity demanded in 2002 versus its 2002 price, and so forth. If the resulting

Another variation in demand estimation is what we call BOTTOM UP review. To estimate potential market demand for new products from the bottom up perspective, certain assumptions will need to be drawn, along with sound calculations, rationale and estimates. The first question to be asked is who will be the first 5, 50, 500, 5000 customers.

This book explores the principal issues involved in bridging the gap between the pure theory of consumer behavior and its empirical implementation. The theoretical starting point is the familiar static, one-period, utility maximizing model in which the consumer allocates a fixed budget among competing categories of goods. The authors focus upon four issues of primary

importance in empirical demand analysis: the structure of preferences, the treatment of demographic variables, treatment of dynamics, and the specification of the stochastic structure of the demand system.

Telecommunications Demand in Theory and Practice, which builds upon the author's seminal 1980 book, Telecommunications Demand: A Review and Critique, provides comprehensive analyses of the determinants and structure of telecommunications demands in the United States and Canada. Theory and empirical application receive equal emphasis with a heavy focus on the developments and econometric research since the divestiture of AT&T in 1984. For the first time, a

detailed theoretical analysis of business telecommunications demand on subscriber and usage consumption externalities is presented.

Telecommunications Demand in Theory and Practice is without peer in the documentation and analysis of price elasticities of demand for telecommunications services.

This new book also includes a comprehensive bibliography with over 500 entries related to telecommunications demand and pricing.

Telecommunications Demand will appeal to both academic and consulting economists, telecommunications industry analysts and regulators, and to teachers of courses in applied econometrics and regulated industries.

This paper derives a structural import demand equation and estimates it for a large number of countries, using recent time series techniques that address the problem of nonstationarity. Because the statistical properties of the different estimators have been derived only asymptotically, econometric theory does not offer any guidance when it comes to comparing different estimators in small samples. Consequently, the paper derives the small-sample properties of both the ordinary-least-squares (OLS) and the fully-modified (FM) estimators using Monte Carlo methods. It is shown that FM dominates OLS for both the short- and long-run elasticities.
