Chapter 5: Exponential and Logarithmic Functions. In this chapter, we will explore exponential functions, which can be used for, among other things, modeling growth patterns such as those found in bacteria. We will also investigate logarithmic functions, which are closely related to exponential functions.

As with exponential equations, we can use the one-to-one property to solve logarithmic equations. The one-to-one property of logarithmic functions tells us that, for any real numbers $x > 0$, $S > 0$, $T > 0$ and any positive real number b , where $b \neq 1$, If $\log_b S = \log_b T$ then $S = T$. If $\log_2(x - 1) = \log_2(8)$, then $x - 1 = 8$.

~~5.7: Exponential and Logarithmic Equations — Mathematics ...~~

The natural exponential function is e^x and the natural logarithmic function is $\ln x$. Given an exponential function or logarithmic function in base a , we can make a change of base to convert this function to any base b . We typically convert to base e . The hyperbolic functions involve combinations of the exponential functions e^x and e^{-x} . As a result, the inverse hyperbolic functions involve the natural logarithm.

Write these exponential equations as logarithmic equations: $2^3 = 8$; $5^2 = 25$ $(10^{-3} = \frac{1}{1000})$ Solution. a. $2^3 = 8$ can be written as a logarithmic equation as $\log_2(8) = 3$
b. $5^2 = 25$ can be written as a logarithmic equation as $\log_5(25) = 2$

Chapter 5: Exponential and Logarithmic Functions

Even for people who already are familiar with logarithms there is probably something new in this chapter. Logarithms. A logarithm is a way of writing one number (x) expressed as a power (index) of a second number (y) which is called the base, and which must be a real number > 1 . Some examples should make clear what this means.
