Computational fluid dynamics (CFD) [ 1 ] can be described as the set of techniques that assist the computer to provide the numerical simulation of the fluid flows. The three basic principles that can determine the physical aspects of any fluid are the i) energy conservation, ii) Newton ' s second law, and the iii) mass conservation. These flow problem can be described in terms of these basic laws.

Computational fluid dynamics (or CFD) is a branch of fluid mechanics. Different types of numerical techniques and data structures used to examine various problems. Fluid flow (liquid or gas) can be described by the conservation laws for mass, momentum, and energy, which are governed by partial differential equations. In order to solve this problem computationally, it is necessary to replace ...

Computational Fluid Dynamics Model Geometrical Description. A simplified scheme of the systemic circuit is presented in Figure 1 where conducting blood between the heart and a lower limb, is given by the 3D computer aided drafting (CAD) model of a U-bend pipe with arms representing the venous and the arterial systems. The arms communicate via a porous baffle interface, which surrogates the resistance to flow offered by resistance vessels (small arteries and arterioles) yielding the ...
