Pulmonary hemorrhage is now one of the most common clinical signs in outbreaks of human leptospirosis. This is a less common finding in canine leptospirosis; however, cough or dyspnea, or radiographic abnormalities have been noted in a number of affected dogs. Uveitis is an uncommon manifestation of leptospirosis in dogs. It appears to be infrequently associated with experimental canine leptospirosis, but rare case reports exist.

The 2018 FAO-OIE-WHO (Tripartite) zoonoses guide, “ Taking A Multisectoral, One Health Approach: A Tripartite Guide to Addressing Zoonotic Diseases in Countries ” (2018 TZG) is being jointly developed to provide member countries with practical guidance on OH approaches to build national mechanisms for multisectoral coordination, communication, and collaboration to address zoonotic disease threats at the

animal-human-environment interface. The 2018 TZG updates and expands on the guidance in the one previous jointly-developed, zoonoses-specific guidance document: the 2008 Tripartite “ Zoonotic Diseases: A Guide to Establishing Collaboration between Animal and Human Health Sectors at the Country Level ” , developed in WHO South-East Asia Region and Western Pacific Region. The 2018 TZG supports building by countries of the resilience and capacity to address emerging and endemic zoonotic diseases such as avian influenza, rabies, Ebola, and Rift Valley fever, as well as food-borne diseases and antimicrobial resistance, and to minimize their impacts on health, livelihoods, and economies. It additionally supports country efforts to implement WHO International Health Regulations (2005) and OIE international standards, to address gaps identified through external and internal health system evaluations, and to achieve targets of the Sustainable Development Goals. The 2018 TZG provides relevant country ministries and agencies with lessons learned and good practices identified from country-level experiences in taking OH approaches for preparedness, prevention, detection and response to zoonotic disease threats, and provides guidance on multisectoral communication, coordination, and collaboration. It informs on regional and country-level OH activities and relevant unisectoral and multisectoral tools available for countries to use.

Leptospirosis is a potentially serious but treatable zoonotic disease representing a worldwide public health hazard. Its symptoms may mimic those of a number of other unrelated infections such as influenza meningitis hepatitis dengue or viral haemorrhagic fevers. It is important to distinguish leptospirosis from these diseases. For this reason new diagnostic methods have been developed in recent years. In

humid tropical and subtropical areas where most developing countries are located leptospirosis poses a greater health problem than in areas with a temperate climate. Because leptospirosis is easily overlooked and consequently underreported in many parts of the world it is necessary to increase awareness and knowledge of the disease as a public health threat. The aim of these guidelines is to assist in this process. The target groups to which these guidelines are directed consist of health workers clinicians laboratory technicians microbiologists public health workers veterinarians and biologists with an interest in zoonoses having no specialized knowledge of leptospirosis but who wish to be generally informed about the microorganism concerned and the disease that it may cause. This is not a handbook and avoids technical details but the interested reader can find further information in the annexes and the general bibliography. These guidelines are concerned essentially with human leptospirosis.

This volume covers all aspects of infection by pathogenic *Leptospira* species, the causative agents of the world ' s most widespread zoonosis. Topics include aspects of human and animal leptospirosis as well as detailed analyses of our current knowledge of leptospiral structure and physiology, epidemiology, pathogenesis, genomics, immunity and vaccines. Updates are presented on leptospiral systematics, identification and diagnostics, as well as practical information on culture of *Leptospira*. Contact information is also provided for *Leptospira* reference centers. All chapters were written by experts in the field, providing an invaluable reference source for scientists, veterinarians, clinicians and all others with an interest in leptospirosis.

The emergence of HIV disease and AIDS, the reemergence of tuberculosis, and the increased opportunity for disease spread through international travel demonstrate the critical importance of global vigilance for infectious diseases. This volume highlights risk factors for the emergence of microbial threats to health, warns against complacency in public health, and promotes early prevention as a cost-effective and crucial strategy for maintaining public health in the United States and worldwide. The volume identifies infectious disease threats posed by bacteria and viruses, as well as protozoans, helminths, and fungi. Rich in information, it includes a historical perspective on infectious disease, with focuses on Lyme disease, peptic ulcer, malaria, dengue, and recent increases in tuberculosis. The panel discusses how "new" diseases arise and how "old" ones resurge and considers the roles of human demographics and behavior, technology and industry, economic development and land use, international travel and commerce, microbial adaptation and change, and breakdown of public health measures in changing patterns of infectious disease. Also included are discussions and recommendations on disease surveillance; vaccine, drug, and pesticide development; vector control; public education and behavioral change; research and training; and strengthening of the U.S. public health system. This volume will be of immediate interest to scientists specializing in all areas of infectious diseases and microbiology, healthy policy specialists, public health officials, physicians, and medical faculty and students, as well as anyone interested in how their health can be threatened by infectious diseases.

Modern transportation allows people, animals, and plants--and the pathogens they carry--to travel more easily than ever before. The ease and speed of travel, tourism, and international trade connect once-remote areas with one another, eliminating many of the geographic and cultural barriers that once limited the spread of disease. Because of our global interconnectedness through transportation, tourism and trade, infectious diseases emerge more frequently; spread greater distances; pass more easily between humans and animals; and evolve into new and more virulent strains. The IOM's Forum on Microbial Threats hosted the workshop "Globalization, Movement of Pathogens (and Their Hosts) and the Revised International Health Regulations" December 16-17, 2008 in order to explore issues related to infectious disease spread in a "borderless" world. Participants discussed the global emergence, establishment, and surveillance of infectious diseases; the complex relationship between travel, trade, tourism, and the

spread of infectious diseases; national and international policies for mitigating disease movement locally and globally; and obstacles and opportunities for detecting and containing these potentially wide-reaching and devastating diseases. This document summarizes the workshop.
