The electronically steerable phased array radars (PARs) are finding extensive use in military, communication and civilian applications. A PAR system typically comprises a regular arrangement of a large number of phase controlled radiating elements. Ferrite-based phase shifters in various designs are employed in these systems operating at frequencies above 5 GHz due to their superior power rating and insertion loss characteristics.

Microwave and Millimeter-Wave Ferrite Phase Shifters. Introduction. A phase shifter is a device that provides variable insertion phase in a microwave signal path without altering the physical path length. Most phase shifters are two-port devices characterized by low insertion loss and low SWR.

Three types of ferrite phase shifters are generally encountered in microwave circuits and systems. The twin toroid is a latching, nonreciprocal device; the dual-mode is a latching, reciprocal device and the rotary-field is a non-latching reciprocal device. All are constructed from ferrite materials which have a square hysteresis loop.

Microwave reciprocal latching ferrite phase shifters - NASA/ADS. The report describes analytical and experimental investigations carried out on dual-mode, reciprocal, latching ferrite phase shifters, with special emphasis placed on low insertion loss and low potential cost for production quantities. Analytical work has been directed at providing design limit and tradeoff information that may be of value to the system designer as well as to the phase shifter designer.

Most of the phase shifters described on this web site are electronically-controlled, passive reciprocal networks. While the applications of microwave phase shifters are numerous, perhaps the most important application is within a phased array antenna system (a.k.a. electrically steerable array, or ESA). In these systems, the phases of a large number of antenna elements are controlled to force the electromagnetic wave to add up at a particular angle to the array.

Microwave propagation in ferrites • Ferrites are non metallic materials with resistivity  $\rho$  nearly  $10^{14}$  times greater than metals and with dielectric constant  $\epsilon$  around 10-15 and relative permabilities of 1000 order. • These are oxide based compounds having general composition of the form  $MeO \cdot xFe_2O_3$  ie mixture of metallic ferrites and ferric oxides.

A 1–10 GHz magnetostatic wave (MSW) phase shifter that uses a single crystal yttrium iron garnet (YIG) and lead zirconium titanate (PZT) layered structure as a medium for MSW propagation is studied. The structure provides electric field control of the phase shift due to magnetoelectric interaction at the YIG–PZT interface. Phase shifts of the order of a radian have been obtained for ...

Ferrimagnets having low RF loss are used in passive microwave components such as isolators, circulators, phase shifters, and miniature antennas operating in a wide range of frequencies (1–100 GHz) and as magnetic recording media owing to their novel physical properties. Frequency tuning of these components has so far been obtained by external magnetic fields provided by a permanent magnet or ...

Ferrite phase shifters are usually two-port devices that provide a variable phase shift of the transmission path by changing the bias field of the ferrite. There are many types that are characterized by their microwave performances, their switching characteristics, and their control characteristics.

A Phase Shifter is two-port device whose basic function is to provide a change in the phase of RF signal with practically negligible attenuation. A phase shifter is a device which provides variable insertion phase in a microwave signal path without altering the physical path length. Most phase shifters are two port devices characterized by low insertion loss and low VSWR.
