### Minerals Questions and Answers | Study.com

A mineral is an element that originates in the Earth and always retains its chemical identity. Minerals occur as inorganic crystalline salts. Once minerals enter the body, they remain there until excreted. They cannot be changed into anything else. Minerals cannot be destroyed by heat, air, acid, or mixing.

Minerals are identified by a variety of physical properties: Color: the color of the mineral, some minerals such as quartz come in many different colors. Streak: the color of the mineral's powder when it's streaked across a hard surface. Luster: reflection of light off a mineral's surface (shininess) metallic minerals are shiny (gold), non-metallic minerals aren't (quartz, salt)
