The vitamins are a disparate group of compounds; they have little in common either chemically or in their metabolic functions. Nutritionally, they form a cohesive group of organic compounds that are required in the diet in small amounts (micrograms or milligrams per day) for the maintenance of normal health and metabolic integrity.

Metabolically, biotin is of central importance in lipogenesis, gluconeogenesis, and the catabolism of branched-chain (and other) amino acids. There are two well-characterized biotin-responsive inborn errors of metabolism, which are fatal if untreated: holocarboxylase synthetase deficiency and biotinidase deficiency.

he history of biochemistry actually started with nutrition. The first biochemists explored vitamins and how they worked, and what kind of deficiencies you'd see if someone lacked those particular nutrients. Basically, they observed cer- tain disease states, like pellegra or rickets and were able to link to lack of certain foods.
