Pyroclastic rocks (derived from the Greek: πῦρ, meaning fire; and κλαστός, meaning broken) are clastic rocks composed of rock fragments produced by explosive volcanism and erupted as individual particles. The individual rock fragments are known as pyroclasts. Pyroclastic rocks are a type of volcaniclastic deposit. Phreatic pyroclastic deposits are a variety of pyroclastic rock that ...

Pyroclastic rock | Britannica

A pyroclastic rock is a type of rock composed of compacted fragments of volcanic materials. Often the result of an explosive volcanic eruption, pyroclastic rocks can be giant or quite small, and may amalgamate with non-volcanic rocks as they travel.

What Is a Pyroclastic Rock? (with pictures)

Pyroclastic flow, a fluidized mixture of hot rock fragments, gases, and entrapped air that moves at high speed in thick, dark, turbulent clouds that hug the ground during a volcanic eruption. Gas temperatures can reach 600 to 700 °C (1,100 to 1,300 °F), and the flow's velocity can exceed 100 km (60 miles) per hour.

A pyroclastic surge, also referred as a dilute pyroclastic density current, is a flowing mixture of gas and rock fragments ejected during some volcanic eruptions. Pyroclastic surge refers to a specific type of pyroclastic current which moves on the ground as a turbulent flow with low particle concentration (high ratio of gas to rock) with support mainly from the gas phase.

Volcanic rocks are extrusive igneous rocks. There are two main groups: rocks that form from the solidification of lava flows (extrusive), and rocks that form from the compaction of solid volcanic fragments (pyroclastic). This post will cover the basics in easy-to-grasp bullet-point style that facilitates comparison between volcanic rocks.
