goal of domain generalization is to learn from multiple source domains to generalize to unseen target domains under distribution discrepancy.

Domain Generalization via Semi-supervised Meta Learning

The answer to this question lies on the intersection of transfer learning [4] and semi-supervised learning [5–8].

Transfer learning attempts to address domains' discrepancy by leveraging a domain-invariant representation across input domains, with different distributions, associated with the task of

offers superior performance benefits, it comes at a high cost, as labelling data requires human labour. Further, the cost is significantly higher when a data labelling has to be done by an expert, such as a medical practitioner. In such a scenario, semi-supervised learning proves to be a powerful alternative.

This New Semi-Supervised Learning Method Is Gaining Traction

The main goal of semi-supervised domain adaptation with subspace learning (SDASL) is to bridge the domain gap by jointly constructing good subspace feature representations to minimize domain divergence and leveraging un-labeled target data in conjunction with labeled data.

Semi-supervised learning — that is, using more unlabeled data; or, Self-supervised learning — that is, without using any extra data, just by first doing one step of self-supervised pre-training without label information on the existing imbalanced data, can both greatly improve the model performance.

Struggling with data imbalance? Semi-supervised & Self ...

Inspired by the above observations, in this paper we propose the first method that aims to simultaneously learn invariant representations and risks under the setting of semi-supervised domain adaptation (Semi-DA). First, we provide a finite sample bound for

supervised mapping, called SSCDR, which effectively learns the cross-domain relationship even in the case that only a few number of labeled data is available.

Semi-Supervised Learning for Cross-Domain Recommendation ...

Semi-supervised learning is an approach to machine learning that combines a small amount of labeled data with a large amount of unlabeled data during training. Semi-supervised learning falls between unsupervised learning and supervised learning. Unlabeled data, when used in conjunction with a small amount of labeled data, can produce considerable improvement in learning accuracy. The acquisition of labeled data for a learning problem often requires a skilled human agent or a

Semi-supervised learning - Wikipedia

True to its name, Semi-Supervised Learning (SSL) refers to a class of algorithms between supervised and unsupervised learning — aiming to model a distribution using both labeled and unlabeled data. The goal of SSL is often to do so better than using labeled data alone and aspirationally, able to model the target distribution as if we had access to labels for all of the unlabeled data as well.

domain adaptation (SSDA) is a very important task [8, 40, 1], however it has not been fully explored, especially with regard to deep learning based methods. We revisit this task and compare our approach to recent semi-supervised learning or unsupervised domain adaptation methods. The main challenge

Semi-Supervised Domain Adaptation via Minimax Entropy

Books also discuss semi-supervised algorithms, which can make use of both labeled and unlabeled data and can be useful in application domains where unlabeled data is abundant, yet it is possible to obtain a small amount of labeled data.

Semi-Supervised Domain Adaptation by Covariance Matching Abstract:

Transferring knowledge from a source domain to a target domain by domain adaptation has been an interesting and challenging problem in many machine learning applications.

Semi-Supervised Domain Adaptation by Covariance Matching ...

Abstract—Semi-Supervised Learning (SSL) traditionally makes use of unlabeled samples¹ by including them into the training set through an automated labeling process. Such a primitive Semi- Supervised Learning (pSSL) approach suffers from a number of disadvantages including false labeling and incapable of utilizing out-of-domain samples.
