Un-commissioned | New Talent. Why did you make this work: 'The Distance of the Moon' is a wonderfully surreal short story by Italo Calvino, based around the idea that the moon used to be very close to the earth, and people would jump between them, collecting 'moon milk'. I illustrated it as a risograph comic to challenge myself to create a silent narrative and to interpret the otherworldly nature of a story which I have always hugely admired.

The Moon is slowly moving away from Earth. Don't worry! It is only going 3.8cm away each year, and we won't notice a difference for some time! You weigh less on the Moon than you do on Earth. This is because the moon has a much weaker level of gravity than Earth. This is due to the satellites smaller mass.

The Distance of the Moon is the first story in Italo Calvino's The Complete Cosmicomics, and proves an excellent ambassador for the author's style and works. Each book in the Cosmicomics begins with an apocryphal scientific quote, although usually based on some actual scientific fact, [1] and we are given a tale by the irrepressibly present Qfwfq, who seems to have been around for most events in the history of the universe.

The authors of Civilization One return, bringing new evidence about the Moon that will shake up our world. Christopher Knight and Alan Butler realized that the ancient system of geometry they presented in their earlier, breakthrough study works as perfectly for the Moon as it does the Earth. On further investigation, they found a consistent sequence of beautiful integer numbers when looking at every major aspect of the Moon--no such pattern emerges for any other planet or moon in the solar system. In addition, Knight and Butler discovered that the Moon possesses few or no heavy metals and has no core—something that should not be possible. Their persuasive conclusion: if higher life only developed on Earth because the Moon is exactly what it is and where it is, it becomes unreasonable to cling to the idea that the Moon is a natural object. The only question that remains is, who built it?

Julius Schmidt was one of the finest astronomical observers of his time, and his detailed map of the Moon surpassed anything that had come before. Today, the German astronomer and geophysicist has remained a largely neglected figure, despite being one of the most important players in the history of lunar studies. This book at last makes accessible Schmidt's highly regarded German work, *Der Mond*. Considered an astronomical classic of the nineteenth century, *Der Mond* remained without a proper English counterpart for the last century and a half, until now. The author's faithful English translation provides readers with much-needed access into Schmidt's original publication, with the aim of showing the community just how vital his work and legacy have been in the international field of selenography.

The only work to date to collect data gathered during the American and Soviet missions in an accessible and complete reference of current scientific and technical information about the Moon.
